Report Overview

The carbon-supported precious metal catalyst is a supported catalyst that uses carbon as a carrier and adsorbs noble metal active components on the surface of the carbon carrier. Because carbon has a large surface area, good pore structure, rich surface groups, and has good loading performance and reducibility, carbon-supported precious metal catalysts overcome the shortcomings of traditional precious metal catalysts such as difficulty in separation and easy agglomeration. The carrier makes the catalyst have a higher degree of dispersion, which greatly improves the activity and stability of the catalyst and reduces the amount of precious metals.
