Abstracts

Carboxytherapy machines are medical or aesthetic devices designed for the controlled subcutaneous or intradermal administration of medical-grade carbon dioxide (CO₂) gas for therapeutic and cosmetic purposes, utilizing a combination of a CO₂ gas source, a filtration and purification system, a pressure regulator, flow control mechanisms, and specialized applicators or needles to deliver precise doses; the procedure is based on the principle that introducing CO₂ into tissues stimulates localized microcirculation, promotes collagen production, enhances oxygen release from hemoglobin (via the Bohr effect), and may aid in the breakdown of adipose tissue, leading to applications such as reducing the appearance of cellulite, improving skin elasticity, treating stretch marks, enhancing wound healing, and providing non-surgical contouring effects in aesthetic and dermatological practices.

The global Carboxytherapy Machine market size was estimated at USD 380.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
