## Abstracts

Card payment terminals are electronic devices used to process transactions made with credit, debit, or prepaid cards, enabling merchants to accept payments securely and efficiently. These terminals typically include hardware components such as card readers (supporting magnetic stripe, EMV chip, and contactless/NFC technologies), keypads for PIN entry, and often integrated or connected printers for receipts, alongside software that encrypts transaction data and communicates with payment processors and acquiring banks to authorize and settle funds. Modern terminals increasingly incorporate value-added features like inventory management, sales analytics, and integration with point-of-sale (POS) systems, while also adhering to strict security standards such as PCI DSS to protect sensitive cardholder data. Their functionality extends across various form factors, from traditional countertop units to mobile and wireless devices, catering to diverse business environments ranging from retail stores and restaurants to service providers and pop-up vendors.
