Abstracts

Cardiac output monitoring involves the measurement of the volume of blood pumped by the heart per minute, typically in liters, and is a critical parameter in the clinical assessment of cardiovascular function, particularly in high-acuity settings such as intensive care units, operating rooms, and emergency departments. These monitoring systems utilize a variety of technologies, including invasive methods like pulmonary artery catheters and arterial pulse contour analysis, as well as minimally invasive and non-invasive techniques such as echocardiography, bioimpedance, and bioreactance, each offering varying degrees of accuracy, ease of use, and risk profile. The primary purpose is to guide fluid management, inotropic support, and other therapeutic interventions in patients with hemodynamic instability, heart failure, shock, or those undergoing major surgery, enabling clinicians to optimize cardiac performance and improve patient outcomes.

The global Cardiac Output Monitoring market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
