Abstracts

Cardiac surgical patches are used to repair or close defects in the heart, including those caused by congenital defects, myocardial infarctions, or surgical interventions. These patches are typically made from synthetic or biologic materials, such as polytetrafluoroethylene (PTFE), Dacron, or biologic collagen, and are used in surgeries like coronary artery bypass grafting (CABG) and valve repair.

Market Drivers: The rising prevalence of heart disease is driving the demand for cardiac surgical patches. The growing adoption of minimally invasive cardiac surgery techniques, which require the use of smaller, more efficient patches, is another factor contributing to market growth.

Market Opportunities: The growing elderly population, especially in developed countries, creates an increasing demand for cardiac interventions and repair procedures. Additionally, advancements in surgical techniques, such as robotic and minimally invasive surgery, offer opportunities for more precise and effective use of cardiac surgical patches.

Market Challenges: The main challenge is the cost of high-quality synthetic and biologic patches. While synthetic patches are more affordable, biologic patches are more expensive and can be difficult to procure, limiting their use in certain regions. Surgical complications, such as infection or poor integration, may also pose challenges.

Market Trends: The shift towards biologic patches with enhanced tissue integration and regenerative properties is a key market trend. There is also an increasing focus on developing patches with antimicrobial properties and those that support faster recovery times and reduce post-surgical complications.

The global Cardiac Surgical Patch market size was estimated at USD 237.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
