Abstracts

Autotransfusion is also known as intraoperative blood salvage. It is a process in which blood is collected from active bleeding site of patient and rein fused into the same patient during cardiac surgery. Several commercial autotransfusion devices are available in market. There are three types of autotransfusion system namely; continuous flow centrifugal system, discontinuous flow centrifugal system and unwashed blood filter system. The unwashed blood filter system for autotransfusion is more popular than other systems because it is inexpensive system and easy to use. This technology had led to increased use of centrifugation devices for blood collection. During cardiopulmonary bypass (CPB) blood is collected from patient active bleeding site by the help of suckers in different ways. This blood is collected in cardiotomy reservoir and it is filtered in this reservoir. Then this blood is redirected to venous reservoir where it is oxygenated and finally it is returned to patient body.

The global Cardiopulmonary Autotransfusion Devices market size was estimated at USD 224.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
