Report Overview

Cardiopulmonary bypass pumps are medical devices used during cardiac surgeries to temporarily take over the function of the heart and lungs. These pumps maintain the circulation of blood and oxygen throughout the body while the heart is stopped for the surgical procedure. They consist of a pump to propel blood, an oxygenator to add oxygen and remove carbon dioxide, and tubing to carry blood between the patient and the pump. Cardiopulmonary bypass pumps play a crucial role in ensuring the success of complex cardiac surgeries by providing a controlled environment for surgeons to operate on the heart.

The market for cardiopulmonary bypass pumps is being primarily driven by the increasing prevalence of cardiovascular diseases globally. As the incidence of heart-related conditions such as coronary artery disease, heart failure, and congenital heart defects continues to rise, the demand for cardiac surgeries and, consequently, cardiopulmonary bypass pumps is also increasing. Moreover, technological advancements in these devices, such as the development of more efficient and user-friendly systems, are further propelling market growth. Additionally, the growing geriatric population, who are more susceptible to heart ailments, is contributing to the expansion of the cardiopulmonary bypass pump market. At the same time, the rising healthcare expenditure and improving healthcare infrastructure in developing countries are creating opportunities for market players to expand their presence in these regions.
