Report Overview

Cardioselective beta blockers intercept the activation of beta-1 adrenergic receptors present at the nerve endings of the sympathetic nervous system. This eventually results in diminished activity of the heart, such as a reduction in systolic pressure, heart rate and cardiac contractility. Cardioselective agents have a better affinity for β_1 -adrenergic receptors located in the heart, whereas nonselective agents work on β_1 -adrenergic receptors and β_2 -adrenergic receptors located in bronchial musculature.
