Abstracts

A cardiothoracic patch is used in cardiovascular and thoracic surgeries to repair or reinforce the heart, lungs, or major blood vessels. These patches can be made from synthetic materials, such as polyester or expanded polytetrafluoroethylene (ePTFE), or biologic materials, such as collagen or decellularized tissues. Cardiothoracic patches are commonly used to repair defects in the heart or blood vessels, treat aneurysms, and close chest wounds during surgery. The increasing prevalence of heart diseases, including coronary artery disease and congenital heart defects, is driving the demand for cardiothoracic patches. Additionally, advancements in cardiovascular surgery techniques, particularly minimally invasive and robotic-assisted surgeries, are supporting market growth. There is a growing opportunity for the development of biologic cardiothoracic patches, which promote tissue regeneration and reduce the risk of rejection. The rising incidence of thoracic diseases, including lung cancer and thoracic aortic aneurysms, further expands the market. Emerging markets with expanding healthcare systems also present growth opportunities. Challenges include the high cost of biologic patches, which can limit their use in certain regions, and complications such as infection or rejection associated with the use of certain materials. Regulatory hurdles related to the approval of new patch materials may also slow market growth. The market is increasingly shifting toward the use of biologic patches that offer better tissue integration and healing properties. There is also a rising focus on developing patches with antimicrobial properties to reduce infection risk and improve post-surgical recovery.

The global Cardiothoracic Patch market size was estimated at USD 407.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
