Report Overview

The carina-type endobronchial blocker is an advanced medical device, mainly used in thoracic surgery and surgery requiring single-lung ventilation. Its core feature is its unique carina-type design, which can be accurately placed in the carina of the bronchus, and block the ventilation of the target lobe by inflation, while maintaining normal ventilation of the other lobe. This design allows more precise control of lung ventilation during surgery, improving the safety and success rate of surgery. The carina-type endobronchial blocker is usually composed of multiple components such as a catheter, a balloon, an inflation connector, and a conversion connector. Among them, the catheter is used to guide the blocker into the bronchus, and the balloon is inflated to block the airway. The inflation connector is used to connect the inflation device, and the conversion connector is used to connect the ventilator or other medical equipment to achieve airway switching and ventilation control.
