Report Overview

Carlen double-lumen tube, full name Carlen double-lumen endobronchial tube, is a medical device specially designed for thoracic surgery and requires double lung isolation and one-lung ventilation (OLV) technology. The catheter was designed by Carlens in 1949 and first used in clinical practice. It is mainly used to measure the difference in vital capacity between different bronchi and was subsequently widely used for airway management in thoracic surgery anesthesia. The Carlen double-lumen tube has two independent cavities, corresponding to the left and right common bronchi, so that doctors can control the ventilation of each lobe individually as needed during surgery. The Carlen double-lumen tube consists of left and right double cavities, two cuffs and a carina hook. The left tube opens at the front end and is inserted into the left main bronchus; the right tube opens on the right tube wall 6 to 8 cm from the front end, and a tongue-shaped carina hook is provided below to straddle the carina to ensure the stability of the catheter position. The main function of the catheter is to achieve lung isolation and single-lung ventilation, provide a clear surgical field for thoracic surgery, and reduce the interference of surgery on the unoperated lobe. In addition, the Carlen double-lumen tube can also be used for bilateral lumen ventilation of inhaled anesthetic gas, and to remove secretions from both lobes at any time.

The global Carlens Double-Lumen Tube market size was estimated at USD 35.10 million in 2023 and is projected to reach USD 50.39 million by 2032, exhibiting a CAGR of 4.10% during the forecast period.
