Report Overview

Inertial measurement unit (IMU) sensors are devices that measure the three-axis attitude angle (or angular rate) and acceleration of objects. Generally, an IMU includes three single-axis accelerometers and three single-axis gyroscopes. The accelerometer detects the acceleration signals of the object in the carrier coordinate system independently of the three axes, and the gyroscope detects the angular velocity signal of the carrier relative to the navigation coordinate system. Measure the angular velocity and acceleration of the object in three-dimensional space, and use this solution to calculate the attitude of the object. It has very important application value in navigation.
