Abstracts

Cassava starch and pulp refer to processed products derived from the cassava root (*Manihot esculenta*), a tuberous crop widely cultivated in tropical and subtropical regions. Cassava starch is extracted through a series of steps including washing, peeling, crushing, and separating the starch granules from the fibrous pulp, resulting in a fine, white powder used extensively as a thickening, stabilizing, or binding agent in food, pharmaceutical, paper, textile, and biofuel industries. Cassava pulp, the byproduct of starch extraction, consists mainly of residual fibrous material and is commonly utilized as animal feed, organic fertilizer, or as a raw material in biogas production due to its high carbohydrate and fiber content. Both products are integral to value-added processing of cassava, contributing to waste reduction and economic efficiency in agricultural supply chains.

The global Cassava Starch And Pulp market size was estimated at USD 7200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
