Abstracts

A cast compressor wheel is a critical component within turbocharger systems used in internal combustion engines, manufactured through a casting process where molten metal—typically aluminum alloys or specialized high-temperature materials like titanium or nickel-based superalloys—is poured into a mold to form the wheel's intricate blade and hub structure. This method allows for cost-effective mass production of wheels with complex geometries, balancing performance requirements such as aerodynamic efficiency, rotational stability, and resistance to thermal and mechanical stresses, though it may sacrifice some material uniformity and high-end performance characteristics compared to forged or billet-machined alternatives.

The global Cast Compressor Wheel market size was estimated at USD 1260.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.15% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Cast Compressor Wheel market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
