Report Overview

The casting riser, also known as a feeder or head, is an essential component in metal casting processes, designed to compensate for shrinkage as molten metal solidifies. Positioned above the casting mold, it serves as a reservoir of molten material that flows into the mold cavity to prevent defects such as porosity or incomplete filling. Typically made from refractory materials, risers are crucial in foundry operations, particularly for high-quality castings in industries like automotive, aerospace, and heavy machinery. Their design, size, and placement significantly influence the structural integrity and mechanical properties of the final product, making them a key consideration in casting efficiency and cost optimization. The market for casting risers is driven by demand from metalworking sectors, advancements in casting technologies, and the need for defect-free components in precision engineering applications.
