Abstracts

Derived from the seeds of the castor plant (*Ricinus communis*), castor oil-based biopolymer represents a class of renewable, biodegradable polymers synthesized through the polymerization of castor oil or its derivatives, such as sebacic acid and undecylenic acid. These materials are valued for their inherent hydrophobicity, flexibility, thermal stability, and compatibility with other biopolymers, making them suitable for applications in packaging, automotive components, textiles, medical devices, and cosmetics, where sustainability and reduced environmental impact are prioritized. Unlike petroleum-based polymers, castor oil biopolymers leverage a non-food crop feedstock, mitigating concerns over resource competition with food supply chains while offering a lower carbon footprint throughout their lifecycle.

The global Castor Oil Based Biopolymer market size was estimated at USD 174.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.80% during the forecast period.
