## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cat.4 Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Cat.4 Chip production reached approximately 14.71 million units, with an average global market price of around US\$ 40 per unit. Cat.4 chips refer to cellular communication chips that comply with the LTE Cat.4 (Category 4) standard and are primarily used for data transmission on 4G LTE networks. According to the 3GPP definition, Cat.4 chips offer downlink speeds of up to 150 Mbps and uplink speeds of up to 50 Mbps, making them a medium-to-high-speed mobile broadband solution. They typically integrate a baseband processor, RF transceiver module, and a multi-mode protocol stack, supporting FDD-LTE, TDD-LTE, and backward-compatible WCDMA/GSM networks, offering excellent network coverage and global roaming capabilities. Compared to lower-tier Cat.1, Cat.M1, and NB-IoT, Cat.4 chips offer higher speeds and data processing capabilities, making them suitable for high-traffic scenarios such as HD video, online gaming, and HD video conferencing. However, they also consume more power and have a higher cost. With the widespread commercialization of 5G, Cat.4 chips are gradually shifting from the high-end market to mid- and low-end devices and IoT applications, becoming a crucial transition solution during the 4G to 5G transition.

The global Cat.4 Chip market size was estimated at USD 588.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.20% during the forecast period.
