Abstracts

A catalyst for coal to gas is a substance that accelerates and enhances the chemical reactions involved in converting coal into synthetic natural gas (SNG) or other gaseous fuels through processes such as gasification, methanation, or catalytic coal gasification. These catalysts are typically composed of metals or metal oxides?such as nickel, cobalt, iron, or molybdenum?supported on materials like alumina or silica, and they function by lowering activation energy, improving reaction rates, increasing selectivity toward desired products like methane, and mitigating undesirable byproducts such as carbon deposition or tar formation. The performance, stability, and cost-effectiveness of these catalysts are critical to the overall efficiency, economic viability, and environmental footprint of coal-to-gas technologies.

The global Catalyst For Coal To Gas market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
