Report Overview

Electrolysis is a promising option for hydrogen production from renewable resources. Electrolysis is the process of using electricity to split water into hydrogen and oxygen. This reaction takes place in a unit called electrolyze. Electrolyzes can range in size from small, appliance-size equipment that is well-suited for small-scale distributed hydrogen production to large-scale, central production facilities that could be tied directly to renewable or other non-greenhouse-gas-emitting forms of electricity production. Electrocatalysts are materials that, because of their electrical and morphological features, facilitate electrochemical processes. Researchers have been searching for electrocatalysts that can aid in the electrolysis of water, and some of the best catalysts are noble-metal oxides, which are rare and costly. Producing hydrogen via electrolysis, powered by renewable energy, allows the renewable energy to be stored and transported for later use. Typically, platinum is used as a catalyst in the electrolysis reaction, but this material adds significant cost.

The global Catalyst for Hydrogen Production from Water Electrolysis market size was estimated at USD 103 million in 2023 and is projected to reach USD 2197.48 million by 2032, exhibiting a CAGR of 40.50% during the forecast period.
