Report Overview:

The catalytic combustion sensor uses the thermal effect principle of catalytic combustion, and is composed of a detection element and a compensation element to form a measurement bridge. Under certain temperature conditions, the combustible gas will burn without flame under the action of the detection element carrier surface and the catalyst, and the carrier temperature will rise. the resistance of the platinum wire inside it also increases accordingly, so that the balance bridge is out of balance, and an electrical signal proportional to the concentration of combustible gas is output.

The Global Catalytic Combustion Sensors Market Size was estimated at USD 1205.20 million in 2023 and is projected to reach USD 1798.57 million by 2029, exhibiting a CAGR of 6.90% during the forecast period.
