Abstracts

A catering oil water separator is an essential environmental control device used in commercial kitchens and food service establishments to remove fats, oils, and greases (FOG) from wastewater before it enters municipal sewage systems. These systems work by leveraging the difference in density between water and FOG, allowing contaminants to rise to the surface or settle at the bottom for mechanical or automated removal. Typically installed underground or within kitchen drainage infrastructure, they help businesses comply with local regulations, prevent sewer blockages, reduce maintenance costs, and minimize environmental impact. Units vary in capacity and technology?from simple gravity-based interceptors to advanced electrocoagulation or biological treatment systems?depending on the volume of effluent and specific operational requirements.

The global Catering Oil Water Separator market size was estimated at USD 420.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
