Report Overview

The cathode material of OLED is mainly used as the cathode of the device. In order to improve the injection efficiency of electrons, metal materials with the lowest work function should be selected, because the injection of electrons is more difficult than the injection of holes. The size of the metal work function seriously affects the luminous efficiency and service life of OLED devices. The lower the metal work function, the easier electron injection and the higher the luminous efficiency; in addition, the lower the work function, the lower the organic and metal interface barriers. The lower the temperature, the less Joule heat generated during work, and the life of the device will be greatly improved.
