Report Overview

The cathode material in the lithium-ion battery is the major component, which determines the energy density of the cell. This energy density is measured using cell voltage or cell capacity. The working mechanism of the lithium-ion battery is based on intercalation and deintercalation compounds, where the lithium ions from the cathode are introduced into the anode during the charging of the battery and extracted during discharge of the battery, with a minimal structural change in the anode. The selection of cathode material depends on various factors such as cell voltage, capacity, energy & power capabilities, cycle life, and operating temperature. Various materials are used in the cathode of a lithium-ion battery such as cobalt, manganese, phosphate, nickel cobalt manganese (NCM OR NMC), lithium iron phosphate (LFP), and others.
