Abstracts

Cation exchange membranes (CEMs) are specialized polymer membranes containing fixed anionic functional groups, such as sulfonic or carboxylic acid groups, which allow the selective transport of cations while blocking anions due to electrostatic repulsion and size exclusion mechanisms. These membranes are critical components in electrochemical systems like fuel cells, redox flow batteries, electrodialysis for water desalination, and electrolyzers for hydrogen production, where they facilitate ion conduction, maintain charge balance, and separate reactants or products to ensure efficient and stable operation.

The global Cation Exchange Membranes market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
