Abstracts

Cationic acrylic polymers are water-soluble or water-dispersible synthetic polymers derived from acrylic monomers, characterized by the presence of positively charged functional groups (such as quaternary ammonium salts) along the polymer backbone. These cationic charges enable strong electrostatic interactions with negatively charged surfaces, making them highly effective as flocculants, retention aids, and drainage aids in water treatment and paper manufacturing. They also serve as key components in personal care products (e.g., conditioners and styling agents) due to their substantivity to hair and skin, as well as in textile processing, adhesives, and coatings where charge-mediated adhesion, emulsification, or surface modification is required. Their versatility stems from tunable molecular weight, charge density, and copolymer composition, allowing customization for specific industrial applications demanding compatibility, stability, and functional performance in aqueous systems.

The global Cationic Acrylic Polymer market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
