## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cationic Flocculant competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Cationic flocculants are positively charged, water-soluble polymers?most commonly polyacrylamide derivatives?that bind to negatively charged suspended solids, colloids, and organic particles to accelerate aggregation, settling, and dewatering in industrial and municipal water treatment. The supply chain begins with upstream production of acrylamide monomer, cationic monomers (such as DMAEA, DADMAC, or AETAC), and initiators; moves to polymerization plants where manufacturers formulate liquid, emulsion, or dry-powder flocculants with specific charge densities and molecular weights; continues through blending, granulation, and packaging operations; and ends with distribution to downstream sectors including municipal wastewater plants, sludge-dewatering facilities, mining operations, papermaking retention systems, oil & gas produced-water treatment, and food-processing wastewater plants. In 2024, global cationic flocculant output reached 3.05 million tons with about 3.65 million tons of capacity, priced at USD 1,650?3,400 per ton and averaging a 24% gross margin.

The global Cationic Flocculant market size was estimated at USD 5920.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
