Abstracts

Cationic UV curable resins are a class of specialty polymers that undergo polymerization through a cationic mechanism when exposed to ultraviolet light, using photoinitiators such as diaryliodonium or triarylsulfonium salts to generate strong acids that catalyze ring-opening reactions, typically involving epoxy or vinyl ether functional groups. Unlike free-radical UV systems, cationic curing is not inhibited by oxygen, offers lower shrinkage, excellent adhesion to various substrates, and produces coatings with high chemical resistance, flexibility, and durability, making them suitable for applications requiring deep cure or demanding performance in harsh environments. These resins are engineered for rapid, energy-efficient curing processes and are valued in industries where precise, high-performance surface finishing is critical.

The global Cationic Uv Curable Resins market size was estimated at USD 285.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
