Abstracts

Cattle dehidors are mechanical devices specifically designed for skinning cattle hides. They utilize advanced skinning technology and automated control systems to efficiently and accurately complete the hide skinning process, significantly improving skinning efficiency and the integrity of the hides. These machines typically consist of a skinning blade, transmission system, and control system. The skinning blade is made of high-strength alloy material, featuring sharpness and wear resistance, capable of easily skinning cattle hides. The transmission system drives the skinning blade to rotate and move, ensuring a smooth and continuous skinning process. The control system monitors and adjusts the operating status of the dehidor to ensure skinning quality and safety. When using a cattle dehidor, operators only need to fix the hide on the machine and set the skinning parameters, and the machine will automatically complete the skinning process. After skinning, operators can further process and treat the hide, such as trimming and cleaning. Cattle dehidors are widely used in the livestock industry and leather processing fields, providing efficient and convenient solutions for hide skinning and processing.

The global Cattle Dehidors market size was estimated at USD 1580.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
