Report Overview

A cDNA library is a combination of cloned cDNA fragments inserted into a collection of host cells. It uses mRNA as a template, catalyzed by reverse transcriptase, reverse transcribed into cDNA in vitro, and ligated with an appropriate vector (commonly used phage or plasmid vector) to transform the recipient bacteria. Each bacteria contains a piece of cDNA and can reproduce and expand. In this way, the collection of cDNA clones containing all the mRNA information of the cell is called the cDNA library of the tissue cell. cDNA libraries specifically reflect the genes encoding proteins expressed in specific tissues or cells at specific developmental stages, so cDNA libraries are tissue- or cell-specific.

The global cDNA Library market size was estimated at USD 794 million in 2023 and is projected to reach USD 2255.48 million by 2032, exhibiting a CAGR of 12.30% during the forecast period.
