Report Overview:

In computer networking, a wireless access point (WAP), or more generally just access point (AP), is a networking hardware device that allows other Wi-Fi devices to connect to a wired network. As a standalone device, the AP may have a wired connection to a router, but, in a wireless router, it can also be an integral component of the router itself. An AP is differentiated from a hotspot which is a physical location where Wi-Fi access is available. Wireless access points work to extend the range of your network within a building, office, or home. In-ceiling wireless access points work like any other access device. However, they are meant to be mounted within or attached to the ceiling of a workspace. Mounting to the ceiling means that these wireless access points take very little space and are viable in almost any location.

The Global Ceiling Mount Wireless Access Point Market Size was estimated at USD 350.70 million in 2023 and is projected to reach USD 433.61 million by 2029, exhibiting a CAGR of 3.60% during the forecast period.
