Report Overview

Cell bank production and storage is the process of creating and storing a large quantity of cells, such as animal cells, plant cells, or stem cells. Cell banks are used for a variety of purposes, including research, drug development, and cell therapy. To produce a cell bank, cells are first cultured in a laboratory. Once the cells have grown to a sufficient number, they are harvested and cryopreserved, which is a process of freezing and storing the cells at very low temperatures. Cryopreserved cells can be stored for many years, and they can be thawed and used when needed.

The global Cell Bank Production and Storage market size was estimated at USD 10430 million in 2023 and is projected to reach USD 39053.62 million by 2032, exhibiting a CAGR of 15.80% during the forecast period.
