Abstracts

Cell-based immunotherapy represents a revolutionary class of treatments that leverage a patient's own immune cells—such as T cells, natural killer (NK) cells, or dendritic cells—which are genetically modified or otherwise enhanced ex vivo to recognize and destroy cancer cells or pathogenic agents more effectively upon reinfusion. This approach includes prominent modalities like CAR-T (chimeric antigen receptor T-cell) therapy, TCR (T-cell receptor) therapy, and tumor-infiltrating lymphocyte (TIL) therapy, which are designed to target specific antigens on malignant cells, offering highly personalized and potent therapeutic options, particularly for hematologic malignancies and, increasingly, solid tumors. These therapies are distinguished from traditional pharmaceuticals by their living, dynamic nature and the complexity of their manufacturing and delivery processes, which involve cell collection, engineering, expansion, and quality control before administration to patients.

The global Cell Based Immunotherapy market size was estimated at USD 12850.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 15.25% during the forecast period.
