Abstracts

Cell fenders exhibit superior performance in absorbing and dissipating energy during vessel berthing and docking operations. The unique design of these fenders, characterized by a series of hollow cells filled with air or foam, allows them to compress under pressure and absorb the impact forces effectively. This capability not only protects the vessel from damage but also minimizes the stress exerted on the wharf or other structures, ensuring their longevity and reducing maintenance costs. Compared to the other types of fenders (like pneumatic, arch, or cone fenders), cell type fenders have a proven track record of superior performance, making them a reliable choice in challenging maritime environments.

The global Cell Fenders market size was estimated at USD 398.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
