Abstracts

Cell-free protein synthesis (CFPS) refers to the in vitro production of proteins using cellular extracts that contain the necessary biological machinery?such as ribosomes, tRNAs, enzymes, and energy sources?without the need for intact living cells. This method bypasses the complexities and limitations of cell-based systems, enabling rapid, high-yield expression of proteins, including those that are toxic to cells or require non-natural amino acids. CFPS platforms are highly flexible, scalable, and controllable, making them particularly valuable for applications in synthetic biology, drug discovery, personalized medicine, and biomanufacturing, where speed, yield, and the ability to produce challenging proteins are critical.

The global Cell Free Protein Synthesis market size was estimated at USD 531.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 13.20% during the forecast period.
