Abstracts

Cell fusion instruments are specialized laboratory devices designed to facilitate the artificial merging of two or more distinct cells, creating hybrid cells known as heterokaryons or hybridomas, which are critical in applications such as monoclonal antibody production, cancer research, regenerative medicine, and the development of novel cell lines for biopharmaceuticals. These instruments typically employ techniques like electrical fusion (electrofusion), where controlled electrical pulses create temporary pores in cell membranes to enable cytoplasmic mixing, or chemical methods using fusogenic agents like polyethylene glycol (PEG), with modern systems often incorporating advanced features such as real-time monitoring, programmable protocols, and high-throughput capabilities to improve efficiency, reproducibility, and success rates in cell-based research and therapeutic development.
