Abstracts

Cell lysis and disruption refers to the process of breaking open cells to release their internal components, such as proteins, nucleic acids, organelles, or other biomolecules, for downstream analysis or application in research, diagnostics, biopharmaceutical production, and industrial biotechnology. This is achieved through various physical, chemical, enzymatic, or mechanical methods, including sonication, homogenization, freeze-thaw cycles, detergent-based lysis, or bead beating, with the choice of technique depending on cell type, sample volume, desired yield, and the sensitivity of the target molecules to degradation. The process is fundamental in fields like genomics, proteomics, drug discovery, and biomanufacturing, where accessing intracellular content is a critical step for experimentation, quality control, or therapeutic development.

The global Cell Lysis And Disruption market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
