Report Overview

Cell-Site Simulators or IMSI Catcher (an international mobile subscriber identity-catcher), refers to a type of electronic surveillance equipment that collects information about nearby mobile devices. This is done either passively, by intercepting the radio signals already being transmitted between a mobile device (such as a mobile phone) and a mobile base-station (cell tower); or actively, by presenting itself to nearby mobile communication devices as a legitimate mobile base-station, thereby fooling devices to connect to the IMSI-catcher itself allowing further interception of information from the devices.

The Cell-Site Simulators or IMSI Catcher industry was 96 million USD in 2018 and is projected to reach USD 192 million USD by 2025, at a CAGR (Compounded Annual Growth Rate) of 9.63% between 2019 and 2025. The IMSI catcher first emerged in the early 1990s. Over the past decade, a series of lawsuits was filed in connection with IMSI catcher use and civil rights organizations and journalists began to ask questions.
