Abstracts

Cell staining is a technique used for the main purpose of increasing contrast through changing the color of some of the parts of the structure being observed thus allowing for a clearer view. There are a variety of microscopic stains that can be used in microscopy. Cell stains are crucial tools in biomedical research and drug discovery processes. The demand for these reagents remains strong as research in areas like cancer biology, neuroscience, and cell-based assays continues to grow. Fluorescent cell staining techniques, including multiplexing, enable researchers to simultaneously study multiple cellular markers or pathways within a single sample. This trend has driven the demand for a variety of fluorescent dyes and probes. Advances in live cell imaging technologies have increased the need for cell-permeable and non-toxic stains that allow real-time tracking of cellular processes and events.
