Report Overview

Reverse osmosis (RO) is a water purification process that uses a partially permeable membrane to remove ions, unwanted molecules and larger particles from water.

Cellulose Acetate Membranes - Cellulose acetate reverse osmosis membranes comprise an asymmetric polymer commonly used in the construction of RO membrane elements (other membrane materials include polyamide and polysulfone). Originally cellulose acetate membranes were made of cellulose diacetate, cellulose triacetate or a blend of these materials. Cellulose acetate membranes need a residual of chlorine to protect them from biological attack. They also have tight pH operating requirements.
