Abstracts

A cellulose-based depth filter is a type of depth filter utilizing natural or regenerated cellulose as the primary filtration medium. Through its finely porous structure, it efficiently captures and retains particles of various sizes, including microorganisms and colloids. The cellulose material provides the filter with good hydrophilicity and chemical stability, making it suitable for filtering a variety of liquid media, such as biofermentation broths, pharmaceutical solutions, and food slurries. Additionally, cellulose-based depth filters exhibit excellent flow performance, maintaining low pressure drops even under high pressures, thereby extending filtration cycles and service life. They are crucial equipment in ensuring product purity and sterility in the pharmaceutical, biotechnology, and food processing industries.

The global Cellulose-Based Depth Filter market size was estimated at USD 651.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
