## Abstracts

Cellulose-based polymer materials are biodegradable polymers derived from cellulose, a natural polymer found in the cell walls of plants. Cellulose is the most abundant organic polymer on Earth and is primarily sourced from wood, cotton, and other plant materials. The cellulose molecules consist of long chains of glucose units linked together by beta-1,4-glycosidic bonds, providing structural strength and stability. Cellulose-based polymer materials offer a sustainable alternative to synthetic polymers, with a wide range of applications across multiple industries. Their biodegradability and renewability make them an important area of research and development in addressing environmental concerns related to plastic waste.

The global Cellulose-based Polymer Materials market size was estimated at USD 5102.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
