Abstracts

Cellulose esters and ethers represent a class of chemically modified cellulose derivatives where hydroxyl groups on the cellulose backbone are substituted with ester or ether functional groups, resulting in materials with tailored properties such as solubility, film-forming ability, thermoplasticity, and resistance to oils and greases; key examples include cellulose acetate (used in textiles, filters, and films), methyl cellulose (a thickener and stabilizer in food and pharmaceuticals), hydroxypropyl methylcellulose (employed in construction materials and drug delivery), and carboxymethyl cellulose (a common viscosity modifier in food, paper, and personal care products). These compounds are valued for their biodegradability, renewable origin, and versatility across industries, bridging applications from high-performance technical uses to consumer goods, with production processes involving the reaction of cellulose with various anhydrides, acids, or alkyl halides under controlled conditions to achieve desired substitution levels and material characteristics.

The global Cellulose Esters And Ethers market size was estimated at USD 3650.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
