Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cellulose Ether for Medicine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Cellulose Ether for Medicine production reached approximately 97.03 Kilotons, with an average global market price of around US\$ 12440 per ton. Cellulose ethers are most frequently used in transdermal systems as matrices or matrix additives to maintain drug distribution in the film, and to inhibit drug crystal formation. The stratum corneum layer of skin is an effective barrier against drug penetration. Cellulose Ethers for Medicine are made from natural cellulose through etherification and modification. They exhibit excellent properties such as adhesion, thickening, sustained-release, film-forming, and stabilization. Cellulose Ethers for Medicine are key excipients in sustained-release formulations, tablets, and capsules, and market demand is increasing with the growth of the global pharmaceutical industry. Developed countries are relatively mature in cellulose ether technology. High-end pharmaceutical and food-grade products in Europe and North America are technologically mature and expensive. While China exports a large volume, most of these products are lower-end, building material-grade products, resulting in relatively low prices.

The global Cellulose Ether for Medicine market size was estimated at USD 1207.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
