Abstracts

Cellulose nanomaterials, also known as nanocellulose, are a class of bio-based nanomaterials derived from cellulose—the most abundant organic polymer on Earth—through mechanical, chemical, or enzymatic processes that break down cellulose fibers into nanoscale dimensions, typically exhibiting at least one dimension in the range of 1–100 nanometers; these materials are categorized into three main types—cellulose nanocrystals (CNCs), cellulose nanofibrils (CNFs), and bacterial nanocellulose (BNC)—each with distinct structural and functional properties such as high tensile strength, low density, biodegradability, and tunable surface chemistry, making them suitable for applications ranging from reinforcing composites in packaging and automotive industries to serving as rheology modifiers in paints and cosmetics, stabilizers in food products, and advanced components in biomedical devices like wound dressings and drug delivery systems.

The global Cellulose Nanomaterials market size was estimated at USD 135.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.40% during the forecast period.
