## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cellulose Separators for Aluminum Electrolytic Capacitors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Cellulose separators for aluminum electrolytic capacitors are microporous insulating materials made from high-purity wood pulp, cotton pulp, or other natural fibers. They feature high porosity, excellent electrolyte absorption, and good ionic conductivity. The separator electrically isolates the anode and cathode aluminum foils while retaining the electrolyte to ensure ion transport. With good chemical and dimensional stability, cellulose separators are the most common dielectric barriers used in liquid aluminum electrolytic capacitors, widely applied in consumer electronics, power supplies, industrial control systems, and automotive electronics. In 2024, global production of Cellulose Separators for Aluminum Electrolytic Capacitors reached 689 k square meters, with an average selling price of \$312 per square meter. Typical single-line production capacity for this product is approximately 50,000-100,000 square meters per year, with an industry gross profit margin of approximately 20%-30%. Raw materials (high-purity cellulose pulp and additives) account for the largest portion of the cost structure (approximately 45%), followed by energy and equipment depreciation (approximately 25%). The upstream suppliers of this product are plant fiber pulp, papermaking chemicals, and additives, while the downstream suppliers are aluminum electrolytic capacitor manufacturers and electronic equipment manufacturers.

The global Cellulose Separators for Aluminum Electrolytic Capacitors market size was estimated at USD 215.0 million in 2025 and is projected to grow at a compound annual

growth rate (CAGR) of 5.90% during the forecast period.
