Abstracts

Efforts to reduce global waste are encouraging the use of co-processing fuels in cement kilns. This approach helps cut down landfill waste, which lowers greenhouse gas emissions and ozone depletion. By using waste materials to produce fuel for clinker production, co-processing has lessened the amount of waste sent to dumps. The chemical and automotive industries create a lot of waste. This includes old tires, plastics, solvents, and paint sludge. Large cement-producing companies like Anhui Conch, Lafarge, and HOLICIM have in-house co-processing facilities that directly use these waste materials to produce fuel and use it in the cement kiln. However, few companies rely on suppliers to procure SRF or RDF fuel. Clinker production typically occurs at high operating temperatures, requiring high amounts of primary fuel like coal or tar. The European Union's Circular Economy Action Plan promotes the use of alternative fuels in the cement industry, highlighting the importance of waste materials and government support.

The global Cement Kiln Co-Processing Fuels market size was estimated at USD 4126.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
