Abstracts

A center break disconnecter is an electrical switching device used primarily in high-voltage power transmission and distribution systems to isolate sections of a circuit for maintenance, repair, or safety purposes. It operates by physically breaking the electrical connection in the middle of the blade assembly, ensuring a visible air gap that confirms circuit isolation. These devices are designed to handle high currents and voltages while providing mechanical stability and reliability under various environmental conditions. Unlike load-breaking switches, center break disconnectors are not intended to interrupt current flow under load but serve as critical safety components to de-energize equipment and protect personnel. They are commonly installed in substations, switchyards, and industrial power systems where clear isolation is required for operational safety and compliance with electrical standards.

The global Center Break Disconnecter market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
