### Report Overview:

Centerless grinding is a machining process that uses abrasive cutting to remove material from a work piece. Centerless grinding differs from centered grinding operations in that no spindle or fixture is used to locate and secure the work piece; the work piece is secured between two rotary grinding wheels, and the speed of their rotation relative to each other determines the rate at which material is removed from the work piece.

Centerless grinding is typically used in preference to other grinding processes for operations where many parts must be processed in a short time.

Centerless grinding uses purpose-built centerless grinding machines. Such a machine will always include the grinding wheel, regulating wheel, and some means of supporting a work piece. Modern machines involve computer numerical control to allow automation and improve precision. Grinding wheels are interchangeable, to allow for different grits and shapes. Machines designed to accommodate through-feed grinding operations will allow the angle of the regulating wheel to be adjusted, to accommodate parts of different sizes.

The Global Centerless Grinding Machine Market Size was estimated at USD 746.29 million in 2023 and is projected to reach USD 906.80 million by 2029, exhibiting a CAGR of 3.30% during the forecast period.
