Report Overview

The central extraction system is the heart of the vacuum conveying system. It generates the vacuum. It also separates the chips from the intake air and subsequently purifies the air. The counterflow system for extraction technology conveys the chips from the processing machine or collection point to the central extraction system completely automatically. Room air is used as a carrier medium to transport the dry or slightly moist chips over distances of up to 500 metres. Depending on requirements, extraction stations are integrated into the machine or provided below the chip conveyor.
