Report Overview:

Central venous/vascular access devices are small, flexible tubes placed in large veins for people who require frequent access to the bloodstream. Venous access devices that can be implanted under the skin were introduced in 1982. They allow medications to be delivered directly into larger veins, are less likely to clot, and can be left in for long periods. The CVAD may contain one or two tubes. When a CVAD contains two tubes, it is called a double or dual lumen catheter and may also be used for injecting contrast for CT or MRI scans (depending on type of CVAD).

The Global Central Vascular Access Devices Market Size was estimated at USD 2258.98 million in 2023 and is projected to reach USD 3333.49 million by 2029, exhibiting a CAGR of 6.70% during the forecast period.
